

SatNetBuilder

Building the Internet in Space

The Role of Simulation in Design

Adam Frank

Professor of Astrophysics

University of Rochester

Founder: Truth-N-Beauty Software

Table of Contents

- Simulation in Science
- The Science of Simulation
- The Science behind SatNetBuilder
- SatNetBuilder v0

What Are Simulations?

- Many visions of Simulation in popular culture
 - "The Matrix" trilogy of movies.
 - "The 13th Floor"
 - "The Sims" video game
- People understand Simulations to mean a "virtual" or "digital" recreation of reality.

What Are Simulations?

- Science uses Simulation in more narrow and focused sense.
- Scientific Simulation = digitally solve mathematical models for phenomena under study

Simulation of jet from young star

How Science Works: Astronomy

Observation vs Theory

■ Observation

- Use telescopes
- Visual/Infrared/X-rays..
- Gather Data
- Refine Data
- First Cut at Interpretation

■ Theory

- Interpret data
- Global Interpretation!
- Objects and Classes of Objects
- Mathematics is means of description.

Why Simulate?

Simulation is a third way.

Use simulation for “Hard Problems”.

Math is language which computers help us “translate”.

Theoretical Astrophysics: Easy vs Hard

- **What's Easy? Spheres.**

Star

- **What's Hard? The Rest.**

Star Formation

Math: Easy vs Hard

$$\text{Money} = \text{Payrate} * \text{Time}$$

$$\text{Money} = \text{investments} + \text{stock market} + \text{Payrate} * \text{Time}$$

Fluid Dynamics: The Equations of Doom

$$\frac{\partial \rho}{\partial t} + \vec{\nabla} \cdot \rho \vec{u} = 0$$

$$\frac{\partial \rho \vec{u}}{\partial t} + \vec{\nabla} \cdot \rho \vec{u} \vec{u} = -\vec{\nabla} P$$

$$\frac{\partial E}{\partial t} + \vec{\nabla} \cdot \vec{u} \left(E + \frac{\gamma}{\gamma - 1} P \right) = -\rho^2 \Lambda(T)$$

Mass: ρ = mass density

Momentum: \vec{u} = velocity

Energy: P = Pressure

How Computers Solve Problems: Space

- Take a continuous world and make it discrete.
- Break space into computational cells.

• Pixel

How Computers Solve Problems: Time

- Advance the solutions in lots and lots of tiny steps.

2 Supernova Simulations

Two-dimensional simulation of a supernova explosion, A. Mezzacappa, UT/ORNL.

*3D supernova simulation A. Mezzacappa
R. Toedte, Oak Ridge National Laboratory,
and John Blondin, North Carolina State
University*

Who Needs Simulations?

- Simulation is key for many/most areas of science and engineering (NASA pushes envelope!)
 - Climate/Weather.
 - Aerodynamics.
 - Automotive engine design.
 - Financial Forecasting !
 - Microchip design/fabrication.
 - Computer Networks !

Who Simulates?

- Simulation requires a variety of kinds of skills
 - Mathematics.
 - Engineering.
 - Computer Programming.
 - Network management.
 - Database management.
 - Analysis.

Building Sci-Games

- 2001 Adam Frank, Prof of Computational Astrophysics at University of Rochester forms Truth-N-Beauty Software via technology transfer from NASA and NSF Grants.
- Mission: creates simulation based learning tools.

Building Sci-Games

- Science “games” developed with NASA appear on DISCOVER, ASTRONOMY and SCIENTIFIC AMERICAN websites.
- Education - another example of using simulation.

The Science of SatNetBuilder

Grant funding from NASA CICT

- Earth orbiting satellites and deep space probes must communicate with ground stations, and perhaps, each other.
- Communication may be instructions, images, instrument readings.

The Science of SatNetBuilder

- Key Point - The rate at which information can be passed depends on many factors such as
 - The transmitting power of antennas.
 - The sensitivity of receivers.
 - The distance between receiver and sender.
 - The “visibility” of receiver and sender.

SatNetBuilder Science

- More complex demands on space missions mean more complex demand for space communications networks.
 - Example: Mars probe and Mars orbiter must talk to each other and to the Earth while Earth and Mars orbit Sun.
 - Does it make sense to also place relay-station satellites in orbit between the two planets?

SatNetBuilder Science

- NASA Space Communications project explores how to build an “internet in space”
- Reliable cheap network of satellites which any space mission could use as a network “backbone”.
- Very cool idea!

Building the Internet in Space

Mars Mission Step 1

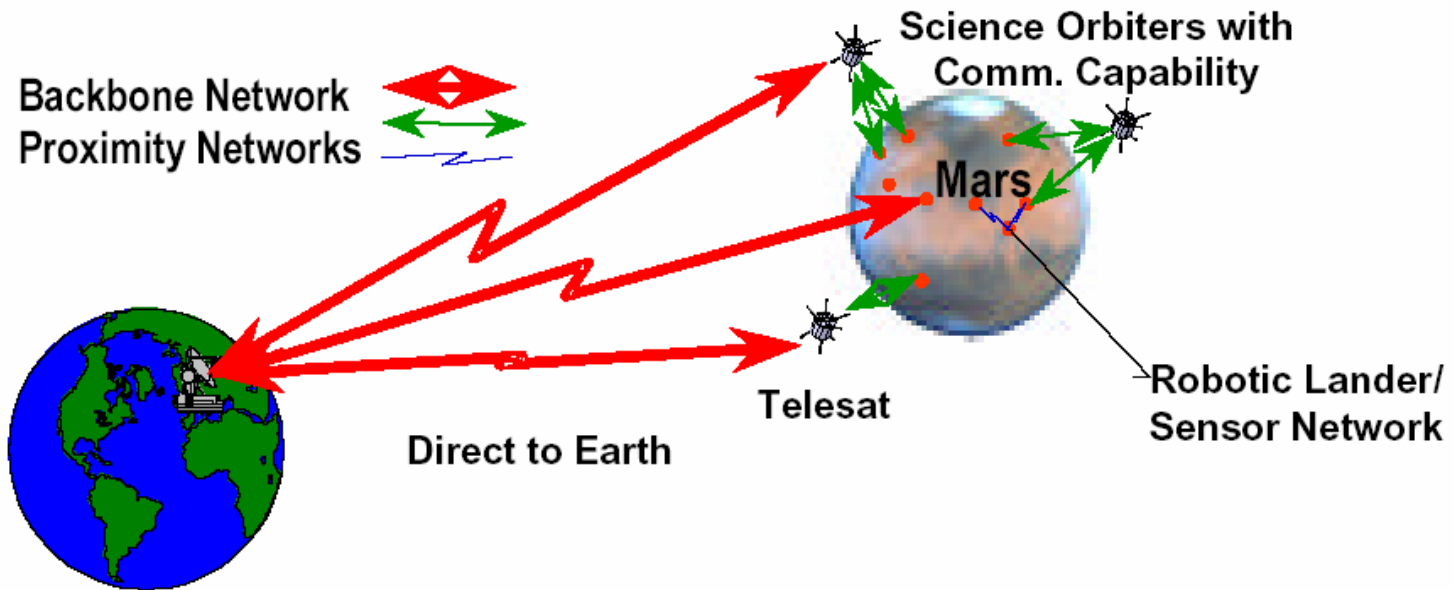

Figure 1. Mars Near-Term Communication Architecture

Building the Internet in Space

Mars Mission Step 2

Figure 2. Mars Mid-Term Communication Architecture

Building the Internet in Space

Mars Mission Step 3

Figure 3. Mars Far-Term Communication Architecture

SatNetBuilder

- Concept: Allow students to explore creation of satellite communications network.

To Build SatNetBuilder we had to:

- know orbital physics.
- Know equations determining “Baud Rate”, rate information transfer from transmitter (satellite) to receiver (ground station)

SatNetBuilder v0

- One satellite, many ground stations.
- You have a specific mission budget.
- Everything costs.
- Must get best Baud Rate and stay within budget.
- Now in final testing phase, due out in near future.

Step 1: Build Satellite

The screenshot shows a game interface for building a satellite. The background is a starry space with a large Earth in the center. On the right, a panel titled "BUILD A SATELLITE" contains a diagram of a satellite with a parabolic dish, a central body, and solar panels. Below the diagram are four sliders: "INCLINATION: 0", "ORBIT DISTANCE: 50", "POWER: 50", and "ANTENNA:" with a dropdown menu. At the bottom of this panel, it says "Total Cost: \$550000" and has "BUILD" and "CANCEL" buttons. At the bottom center, a green digital display shows "FUNDS: \$ 100,000,000". To the right of the funds display is a grid of six icons: a magnifying glass, a bandage, a satellite dish, a rocket, and two empty slots.

BUILD A SATELLITE

INCLINATION: 0
ORBIT DISTANCE: 50
POWER: 50
ANTENNA: [dropdown menu]

Total Cost: \$550000

BUILD **CANCEL**

FUNDS:
\$ 100,000,000

Icons: [magnifying glass] [bandage] [satellite dish] [rocket] [empty slot] [empty slot]

Step 2: Place Ground Stations

Step 3: View Transmission

Conclusion

- Simulation is key in all aspects of science, engineering and business.
- Lots of job opportunities in simulation (NASA needs good people!)
- Simulation requires understanding problem and ability to analyze unexpected results.
- Simulation is a great way to learn.
- Internet in space is great frontier!
